— NAAC Accredited

Abstract

In today's increasingly digital world, protecting sensitive information has become a critical priority for organizations across all industries. This audit course report focuses on the study of the **ISO/IEC 27001:2022 standard** for Information Security Management Systems (ISMS), completed through an online certification course on Udemy, instructed by Cristian Vlad Lupa and rigcert.education.

The primary objective of this course was to understand the framework, principles, and requirements of ISO/IEC 27001:2022, which provides a systematic approach to managing sensitive company information and ensuring its confidentiality, integrity, and availability. The course covered key topics including risk assessment, security controls, compliance requirements, and the audit process for achieving ISO certification.

By studying this standard, the knowledge gained supports the design and implementation of robust information security policies within organizations. The insights derived from this course are directly applicable to real-world scenarios involving data protection, cyber risk management, and organizational security governance. This report outlines the course structure, key learnings, tools and concepts explored, and their practical applications in the field of computer engineering and cybersecurity.

Introduction

1.1 Introduction

In the modern digital landscape, information has become one of the most valuable assets for any organization. With the rapid rise in cyber threats, data breaches, and regulatory compliance requirements, organizations must adopt structured frameworks to protect their information assets. The **ISO/IEC 27001:2022** standard provides an internationally recognized framework for establishing, implementing, maintaining, and continually improving an **Information Security Management System (ISMS)**.

This audit course, completed via Udemy under the instruction of Cristian Vlad Lupa and rigcert. education, provided a comprehensive understanding of the ISO/IEC 27001:2022 standard. The course explored the structure of an ISMS, the risk-based approach to information security, and the requirements organizations must fulfil to achieve certification.

Information security is governed by three core principles, **Confidentiality, Integrity, and Availability (CIA Triad)**. Understanding how ISO/IEC 27001:2022 supports these principles is essential for any computer engineering professional involved in system design, software development, or IT governance. This course equipped learners with the knowledge to assess organizational risks, define security objectives, apply relevant controls from Annex A, and prepare for internal or external audits.

1.2 Problem Statement

To understand and apply the ISO/IEC 27001:2022 framework for designing and auditing an Information Security Management System that effectively manages organizational information security risks and ensures compliance with international standards.

Software/Hardware Requirements

2.1 Software Requirements

- Operating System: Windows 10/11, macOS, or Linux
- Documentation Tools: Microsoft Word, Google Docs, or Notion (for ISMS policy documentation)
- Risk Assessment Tools: Microsoft Excel / Google Sheets (for risk registers and gap analysis)
- Diagram Tools: Microsoft Visio / draw.io (for ISMS scope and process mapping)
- Learning Platform: Udemy (online course delivery)
- Reference Standards: ISO/IEC 27001:2022 and ISO/IEC 27002:2022 documentation

2.2 Hardware Requirements

- Processor: Intel i3 or higher
- RAM: Minimum 4 GB (8 GB recommended)
- Storage: At least 5 GB free disk space
- System Type: 64-bit system

Implementation and Results

This audit course on ISO/IEC 27001:2022, Information Security Management System successfully provided a thorough understanding of the international standard for information security governance. Through structured learning on Udemy, key concepts including risk management, security controls, compliance requirements, and the audit process were explored in depth.

The course demonstrated how organizations can systematically protect their information assets by implementing a well-structured ISMS aligned with ISO/IEC 27001:2022. The updated Annex A controls and the risk-based approach introduced in the 2022 revision reflect the evolving threat landscape and provide a robust mechanism for managing modern cybersecurity challenges.

Overall, this course has significantly enhanced knowledge of information security frameworks and audit practices, which are directly applicable in roles involving IT governance, cybersecurity, compliance management, and systems engineering. The certification obtained from this course serves as a strong foundation for pursuing further expertise in information security and ISO-based auditing.

Conclusion

This audit course on ISO/IEC 27001:2022, Information Security Management System successfully provided a thorough understanding of the international standard for information security governance. Through structured learning on Udemy, key concepts including risk management, security controls, compliance requirements, and the audit process were explored in depth.

The course demonstrated how organizations can systematically protect their information assets by implementing a well-structured ISMS aligned with ISO/IEC 27001:2022. The updated Annex A controls and the risk-based approach introduced in the 2022 revision reflect the evolving threat landscape and provide a robust mechanism for managing modern cybersecurity challenges.

Overall, this course has significantly enhanced knowledge of information security frameworks and audit practices, which are directly applicable in roles involving IT governance, cybersecurity, compliance management, and systems engineering. The certification obtained from this course serves as a strong foundation for pursuing further expertise in information security and ISO-based auditing.
